# Introduction to Flutter

## What is Flutter?

Flutter is an open-source framework created by Google. That allows developers to create apps that work on different platforms (like iOS, Android, and web) using a **single code-base**.

# Target Platforms

# Target Platforms

⚠ We can only **test , build and run** iOS and macOS applications in macOS machines.

⚠ We can **test , build and run** android applications in any operating system

.

## Swift/Objective-C (iOS)

# Updates and Bug Fixing

Android code

android

iOS code

# Device Responsiveness

# Here comes Flutter!

allows developers to create apps that work on different platforms (like iOS, Android, and web) using a **single code-base**.

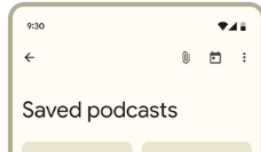

Flutter constructs a hierarchy of widgets, converts it into a **render tree**, and then uses that to **paint the user interface on the screen**.

This allows for flexibility and high-performance UI rendering.

# Prebuild widgets

## AppBar

Container that displays content and actions at the top of a screen.

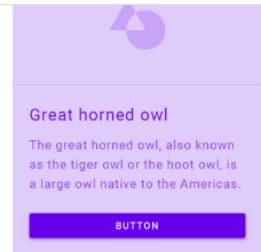

## Column

Layout a list of child widgets in the vertical direction.

## Container

A convenience widget that combines common painting, positioning, and sizing widgets.

## ElevatedButton

A Material Design elevated button.  
A filled button whose material elevates when pressed.

## FlutterLogo

The Flutter logo, in widget form.  
This widget respects the IconTheme.

## Icon

A Material Design icon.

**Dart**

# Why Flutter?

One Codebase to run , **debug and push updates**

## Why Flutter?

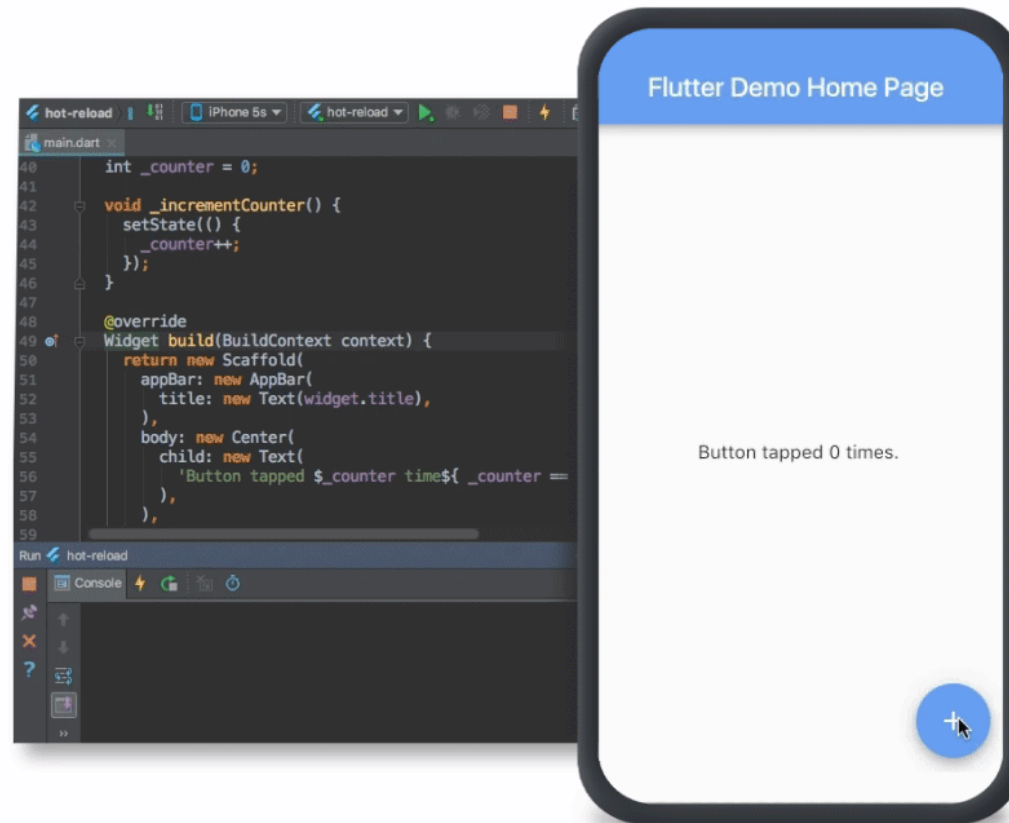

### Simple and more flexible layout rendering

- **Flexible Layout Widgets** : Flutter offers a variety of layout widgets that help you arrange and position your UI elements. Some of the most common ones include **Container**, **Row**, **Column**, **Stack**, and **ListView**. These widgets give you fine-grained control over how your content is organized on the screen.
- **Nesting** : you can put a **Column inside a Container, or a ListView inside a Card**. This nesting capability makes it easy to build sophisticated UIs.

## 2.2. Why Flutter?

✓ Fast Hot reloading 🔥

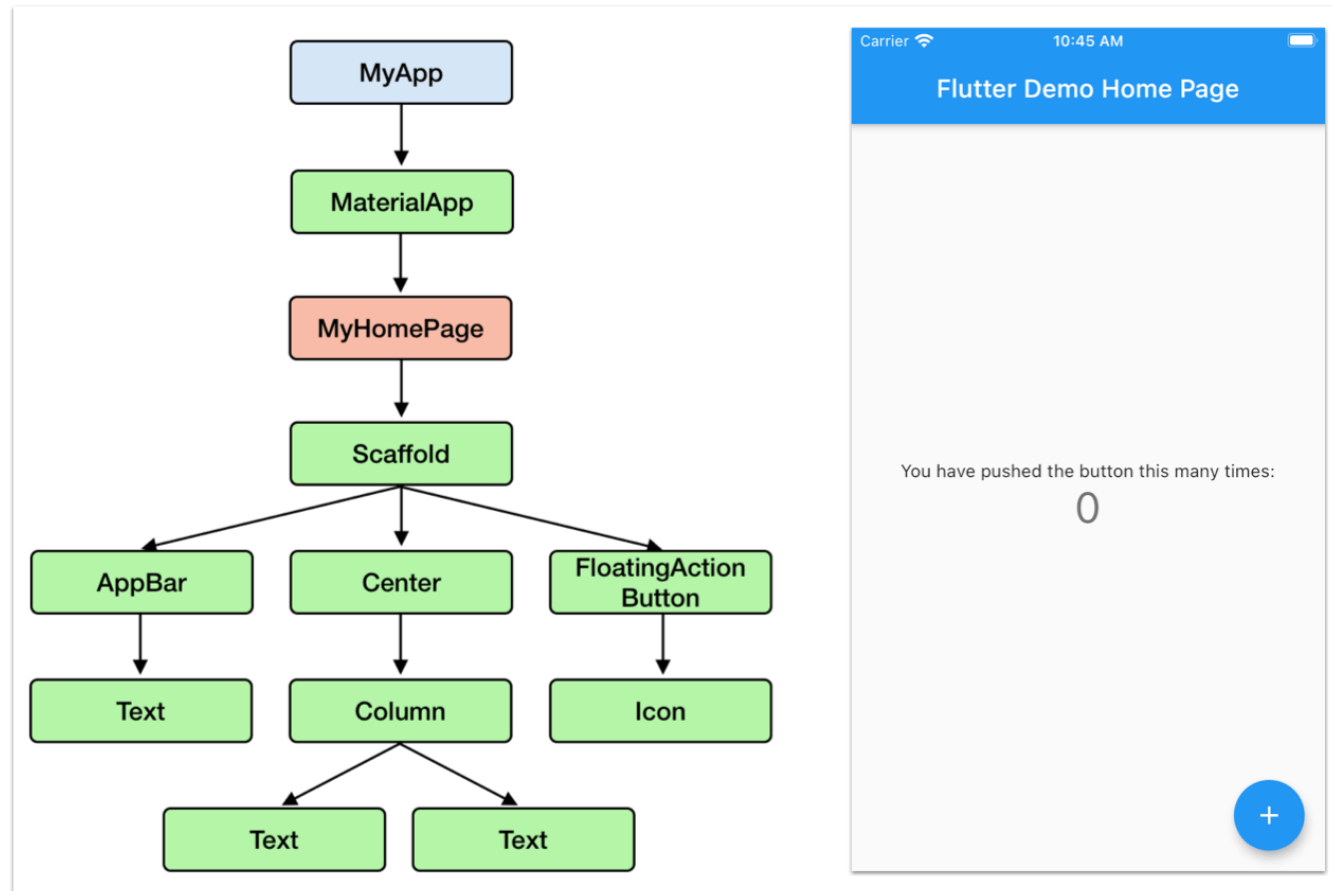

# Advantages of using Flutter

- Single Codebase for Multiple Platforms
- Hot Reload
- Rich Set of Widgets
- High Performance
- Native-Like Look and Feel
- Strong Community and Ecosystem

## 2.4. Flutter Architecture and How Flutter Builds and Renders the Widget Tree ?

# Create a simple application (To Do App)

## Easy Flutter App

Here we will create a simple Flutter application and get a deep understanding of the process of building beautiful UI using Flutter.

we are covering here

- Text
- Center
- Icons
- Material app
- Scaffold
- App bar

# What is a Widget in Flutter?

In Flutter, a widget is a fundamental building block of user interface elements, such as buttons, text fields, images, and layouts.

**Everything you see on the screen in a Flutter app is a widget, including the app itself.** Widgets are used to construct the user interface hierarchy in Flutter applications.

Widgets in Flutter are divided into two main categories

1. **StatelessWidget**
2. **StatefulWidget**

# What is state?

In Flutter, "state" refers to the **data** that can change over time and affect the appearance or behavior of a widget.

## Application State

This refers to the overall state of the application, including **data that needs to be shared among multiple widgets or screens**. Application state typically resides in a higher-level widget, such as the root widget of the application or a state management solution like Provider, River pod or Bloc.

## Widget State

## StatelessWidget

These are widgets that do not have any mutable state. Their properties, once set, remain constant throughout their lifetime.

## StatefulWidget

These are widgets that have mutable state. Their properties can change over time, leading to changes in the appearance or behavior of the widget.

Stateless Widget

# MaterialApp

MaterialApp is a fundamental widget in the Flutter framework that provides a convenient wrapper for creating applications based on **Google's Material Design guidelines**. It sets up essential configurations and features required for a Material Design-compliant app, such as **navigation, theming, and accessibility**.

[Read more...](#)

# Scaffold

The Scaffold widget in Flutter is a fundamental building block for implementing Material **Design layouts in your app**. It provides a layout structure for the top-level areas of your app's UI, including,

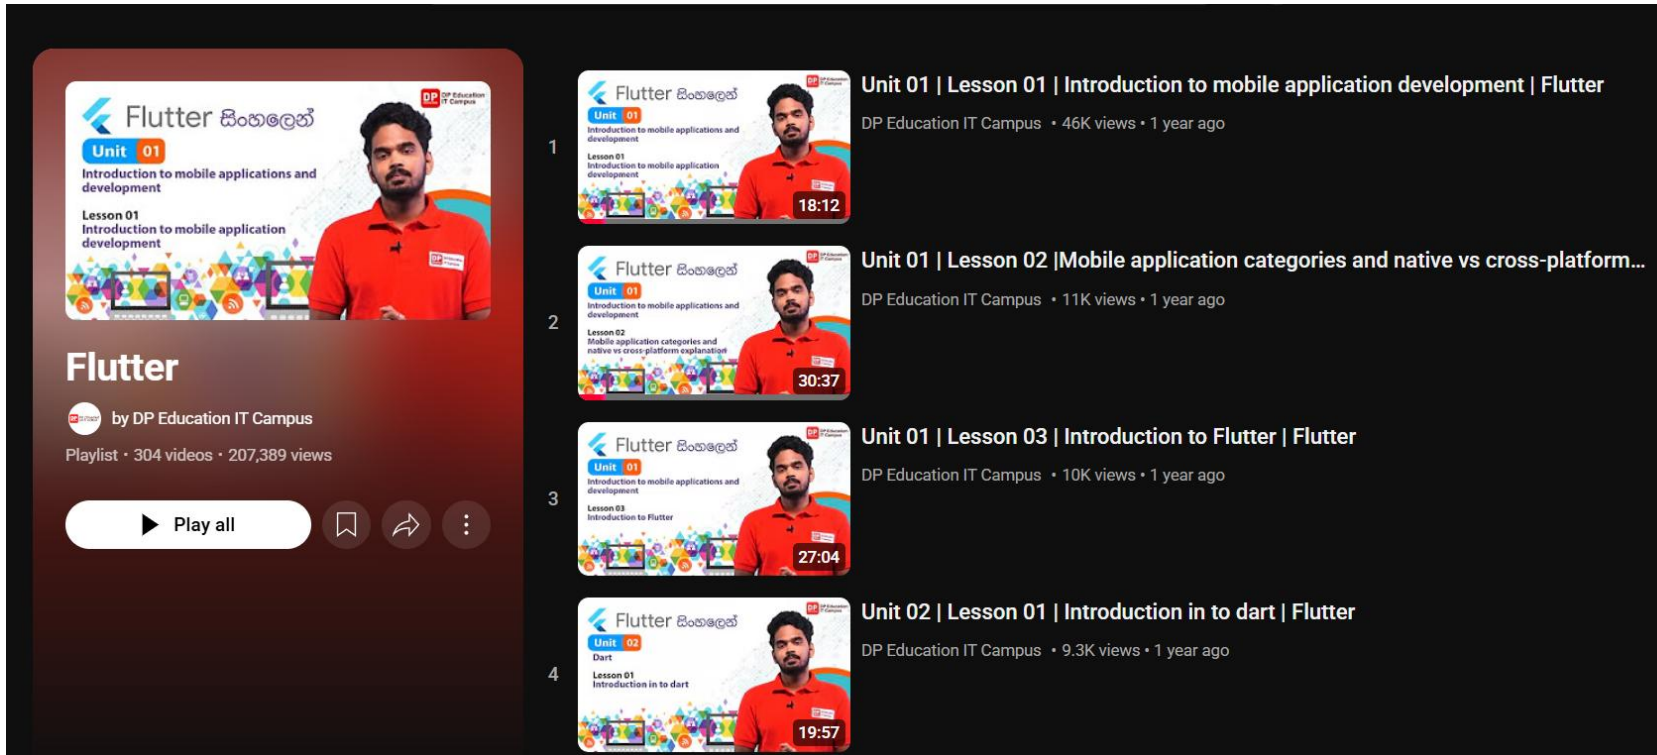

- AppBar
- Body
- Floating Action Bar
- Bottom Navigation Bar
- Persistent Footer Buttons

When used together, these individual elements can be powerful for building and crafting functional yet aesthetically pleasing UI.
